*INSTRUCTIONS AND SPARE PARTS*

CE

*REV : 2014 - 08*

**SL-SS**

## OBSERVATIONS

This handbook describes the use, maintenance instructions and spare parts, supplied for the indicated plough.

The farming implement known as a “plough” is designed to work the soil, linked to a tractor with lift and universal 3-point coupling.

Regular and satisfactory operation together with economic and long lasting use of the implement depend on compliance with the instructions given in this handbook. It is, therefore, advisable to strictly comply with the following instructions in order to prevent faults which could jeopardize the correct and long-lasting operation of the implement.

Compliance with the instructions in this handbook is also important **since the Manufacturer declines all and every responsibility caused by negligence and failure to comply with these instructions.**

The Manufacturer shall, however, remain at the customers disposal for immediate and thorough assistance together with anything else that may be required in order to ensure the correct operation and maximum efficiency of the implement. The Manufacturer reserves the right to make any modifications and improvements to the implement as may be considered opportune, without being obliged to immediately inform the user.

## 2.- SAFETY PROVISIONS

- **Thoroughly read all the plough use instructions**
  - **The Manufacturer declines all and every responsibility for failure to comply with the safety and accident-preventing rules described herein.**
- 1.- Comply with the instructions given by the danger signals exposed in this handbook ( Fig.1 ) and affixed to the plough itself.
  - 2.- Operations and adjustments to the implement must always be carried out when the engine is off and the tractor braked.
  - 3.- It is absolutely forbidden to carry passengers or animals on the equipment
  - 4.- It is absolutely forbidden for persons without a driving license, inexpert persons or those in precarious health conditions to drive the tractor with the equipment mounted.
  - 5.- Strictly comply with all the recommended accident preventing measures described in this handbook.
  - 6.- Assembly of an implement on the tractor will shift the weights on the axles.
  - 7.- Before starting the tractor and equipment, always check that all safety devices guarding transport and use are in perfect conditions.
  - 8.- The instructions labels affixed to the equipment give useful advice on how to prevent accidents.
  - 9.- Always comply with the highway code in force in your country when travelling on public roads.
  - 10.- Comply with the maximum permissible weight on the axle of the tractor, the total adjustable weight, transport regulations and the highway code.
  - 11.- Always become familiar with the controls and their operation before starting work.

- 12.- Take the utmost care during the equipment coupling and release phases
- 13.- Never ever leave the driving seat whilst the tractor is moving.
- 14.- Remember that the road holding, steering and breaking capacity may be notably influenced by the presence of a mounted implement
- 15.- It is absolutely forbidden to stand within the operative range of the machine.
- 16.- Before leaving the tractor, lower the machine to the groundt, stop the engine, engage the hand brake and remove the ignition key from the control panel.
- 17.- The category of the implement coupling pins must correspond to that of the lift coupling.
- 18.- Take care when working close to the lift links. This is a very dangerous area.
- 19.- It is absolutely forbidden to stand between the tractor and the equipment, to manoeuvre the outside lift control.
- 20.- Set the control lever of the hydraulic lift to the locked position during road transport.
- 21.- The spare parts must correspond to the requirements established by the Manufacturer. Use only genuine spare parts.
- 22.- The safety transfers must always be perfectly visible. They must be kept clean and should be replaced if they become illegible. Replacements are available on request from your local dealer.
- 23.- The instruction manual must be kept for as long as the machine lasts

**WARNING**

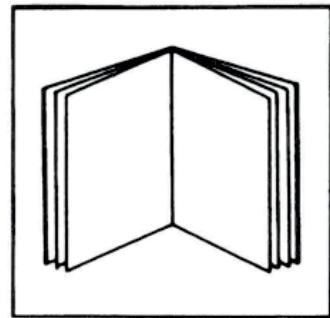

Thoroughly read the manual before starting to work

**DANGER**

Danger of crushing. Keep safety distance

**DANGER**

Damage can be caused by the rotation , folded or opened of  
the equipment. Keep safety distance

### 3.- PROTECTION SYSTEMS

3.1.- Shear bolt Protection: In the **SLF** and **SSF** models, protection is achieved by means of shear bolts (Fig.2). When the share point meets an obstacle, the shear bolt breaks and permits the beam to pivot back around its bedding. To continue work, swing back the beam to its original position and replace the shear bolt B.

**WARNING:** use only genuine shear bolts. Other types of bolts may offer a difference resistance and serious damage can be produced. In this case the warranty will be void

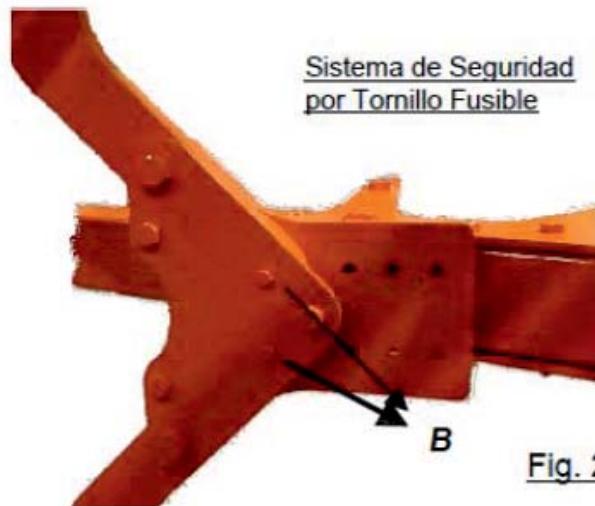

Fig. 2

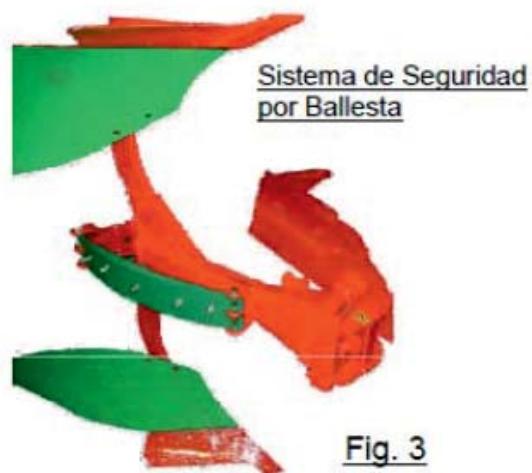

Fig. 3

Fig. 4

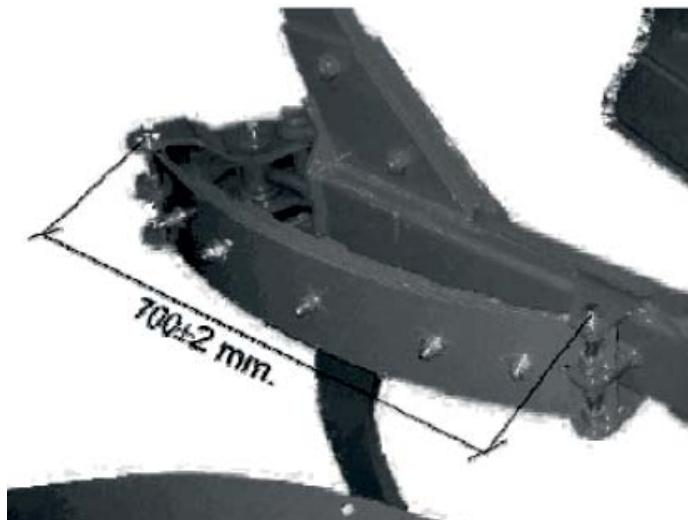

3.2.- The Auto Reset protection systems ( leafspring or hydraulic ) work automatically. When the share meets an obstacle the beam trips up thus overcoming the obstacle and returns back to its original position afterwards with no need to stop the tractor.

This way all the impacts produced by an uneven field are absorbed by the protection system thus protecting all the elements of the plough and of the tractor too.

For the same reason, the Auto Reset protection decreases the traction effort by not making the tractor overcome every eventual obstacle.

**3.2.1.-Leafspring models ( SSB and SLB ):** In heavy duty conditions one or more leafs can be added to ease penetration of the plough.

Check that the distance of the arch of the spring is always  $700 \pm 2$  mm (Fig.3).

**3.2.2.- Hydraulic models ( SSH and SLH ).** In order to adapt the plough to soil conditions, in the hydraulic models the release pressure can be adjusted by means of injecting (heavy conditions) or removing ( light conditions ) oil from the system

To adjust the working pressure proceed as follows:

- Open valve L (Fig. 5) to read the current pressure on the manometer
- Open valve C (Fig. 5) placed by the varywidth cylinder (SS models) or by the first furrow width cylinder (SL models)
- Act on the corresponding tractor spool valve to increase or decrease the working pressure.
- Once the working pressure is set, close valves L and C

**Note:** The Auto Reset systems from OVLAC are set at the factory for average conditions. In order to minimize impacts on both the tractor and the plough, we recommend to work at the lowest possible pressure. The maximum working pressure for the hydraulic protection is 140 bar.

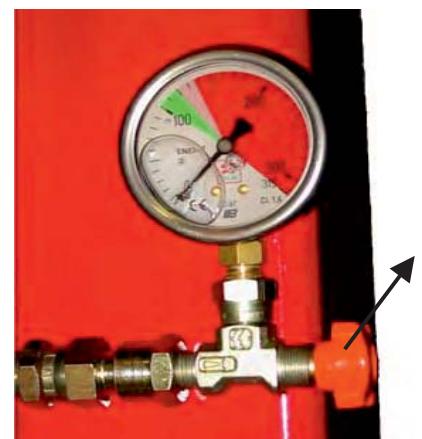

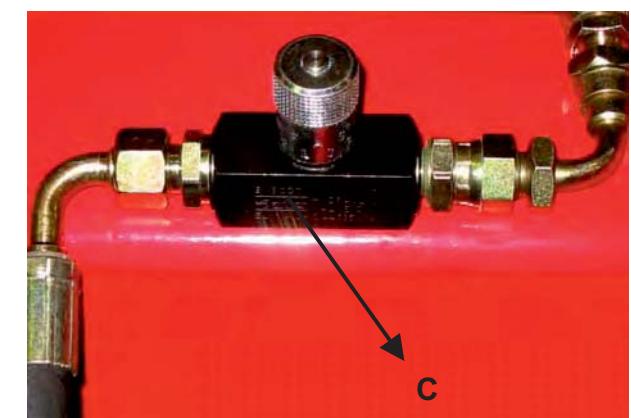

Fig. 5

## 4.- SET TO WORK

### 4.1.- ATTACHING THE PLOUGH

Before attaching the plough check the following points:

- the lift rods of the tractor must be set to the same length and height
- the wheels of the tractor must have the same pressure and it must be set according to manufacturer's instructions
- the lower links must be fixed in a centered position allowing for a little freedom to prevent side pull.

To attach the plough proceed as follows:

- Attach lower links to the draw bar
- Attach the top link so that the shaft E (Fig. 6) remains vertical while working. Attach the top link in the position of the headstock that allows the maximum verticality when lifting the front
- Place the stay P (Fig. 7) in its working position P1.
- Connect hydraulic hoses to the tractor hydraulic system

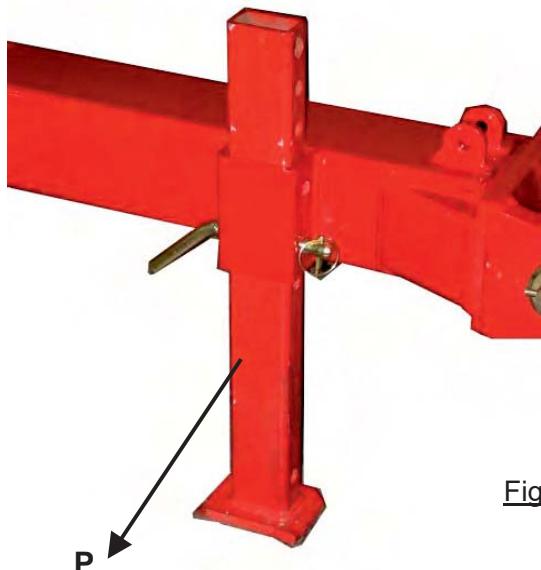

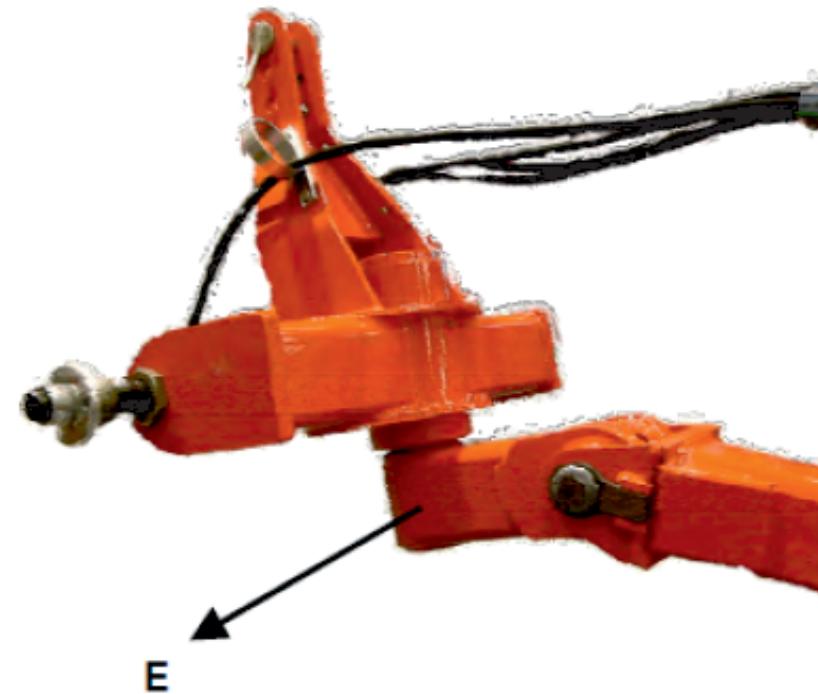

Fig. 7

**E**

Fig. 6

To detach proceed as follows:

- Lower the front part of the plough and act on the wheel so the tractor is lowered with the drawing bar in a horizontal position. In this way detaching as well as the next attaching will be much easier.
- Relieve pressure from the spool valves
- Remove hydraulic hoses from the tractor
- Set the stay in its stand position P (Fig.7)
- Remove top link and lower links

#### **4.1.HYDRALIC CONNECTIONS**

SS MODELS: 4 double acting spool valves are needed to operate: the turnover device, working width adjustment, working depth adjustment, first furrow width adjustment

SL MODELS: 3 double acting spool valves are needed to operate: the turnover device, working depth adjustment, first furrow width adjustment

If the tractor has less spool valves than needed, the plough can optionally be equipped with electro valves to run two operations with a single spool valve.

#### 4.3.- MOULDBOARDS

Before starting work, the paint on the mouldboards should be removed to avoid that the soil remains adhered.

#### 4.4- WORKING WIDTH

The **"S"series ( SSF, SSB and SSH )** features the OVLAC exclusive system to adjust hydraulically the furrow width-Varilabor- which allows to choose any working width between 12" (30cm) and 20" (50cm) by means of the cylinder A (Fig.8). The direction of the wheel is adjusted automatically. A fine adjustment may be made if necessary by means of the turnbuckle T

Varying the furrow width permits to adapt the plough to soil conditions and to the power of the tractor.

In the **"L" series ( SLF, SLB and SLH )** the furrow width can be adjusted manually in steps of 2" ( 5cm) by means of placing bolt F on the desired position (Fig.9). Positions 1 and 4 correspond to the minimum and maximum width respectively.

The wheel must be set accordingly with respect to the position of the bodies by means of turnbuckle T (Fig.8) so that it runs parallel to the working direction.

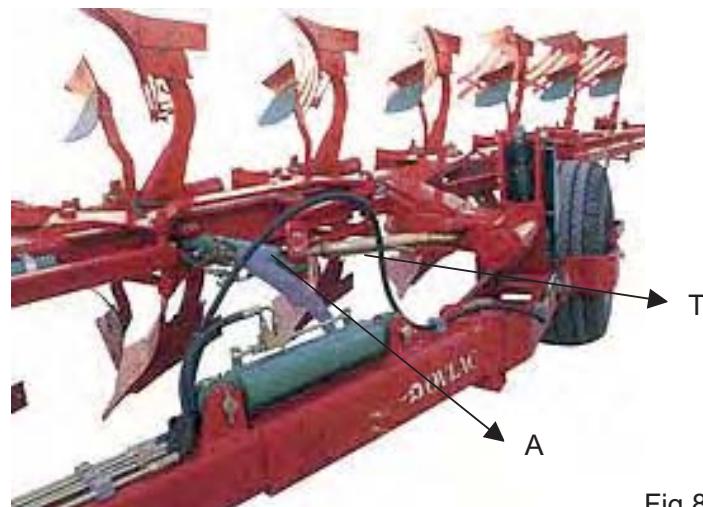

Fig 8

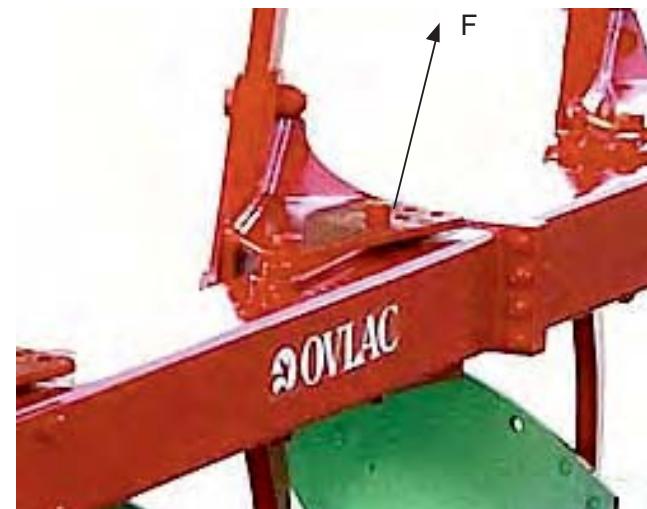

Fig 9

#### **4.5 – ALIGNMENT**

During work, the plough must run straight and parallel to the working direction. It is recommended that the inside width between the rear wheels of the tractor is in the range of 130 – 150 cm. To avoid the lateral pull of the plough it is recommended to allow for a certain lateral freedom in the three point linkage. This freedom must be adjusted equally on both sides.

#### **4.6 .- FIRST FURROW WIDTH ADJUSTMENT**

The first furrow width is adjusted hydraulically by means of the cylinder A (Fig.10). The longer the ram, the wider the first furrow.

Fig. 10

#### **4.7 .- WORKING DEPTH**

The working depth is adjusted hydraulically by means of the cylinder B (Fig.11). The maximum working depth is adjusted by means of nut C on the ram of this cylinder. In order to achieve a proper turn of the soil it is always advisable that the working width be greater than the working depth.

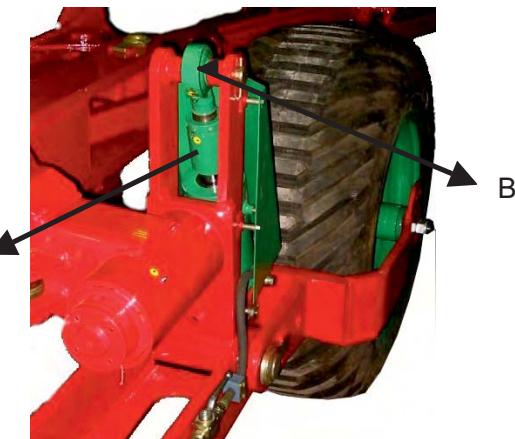

Fig.11

#### **4.8.- OTHER ADJUSTMENTS**

Check that the beams work vertically with respect to the field. To achieve this, make sure that the lifting arms of the tractor are set at the same length and act on the stop bolts A below the turn over rams (Fig.12)

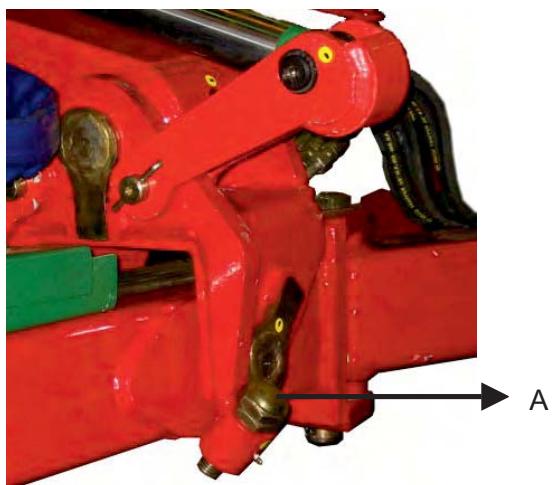

FIG. 12

#### **5.- TRANSPORT AND PARKING**

This plough is transported in “butterfly position”. The valves V must be closed so that the turn over mechanism is locked (Fig 13 ).

For transport, the front part of the plough must be lifted until there is enough clearance between the draw bar and the ground. The rear part must also be lifted by means of the wheel ram and then lowered a bit always maintaining an appropriate clearance to the ground.

Remember the wheel of the plough during transport is rolling just in between the tractor wheels. Be aware of obstacles on having circulated along the ways .

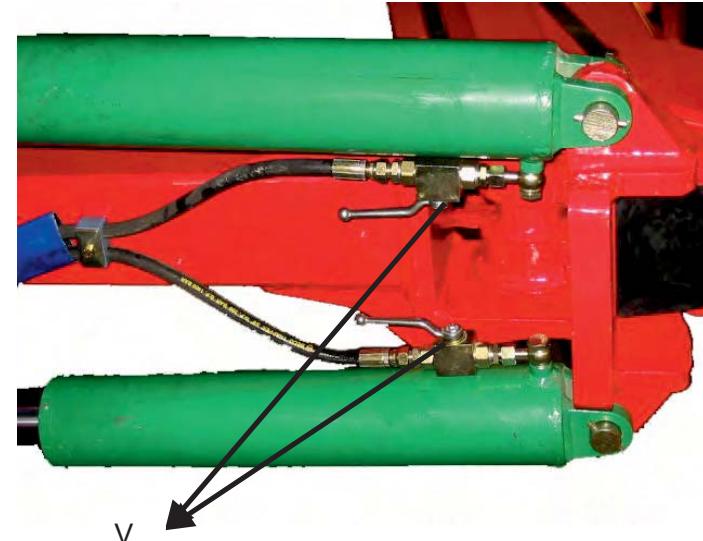

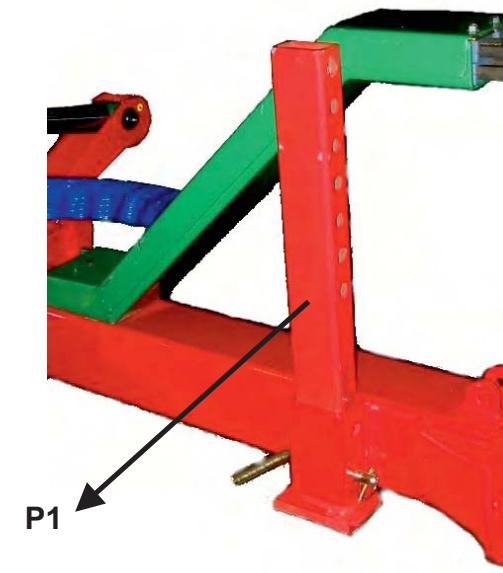

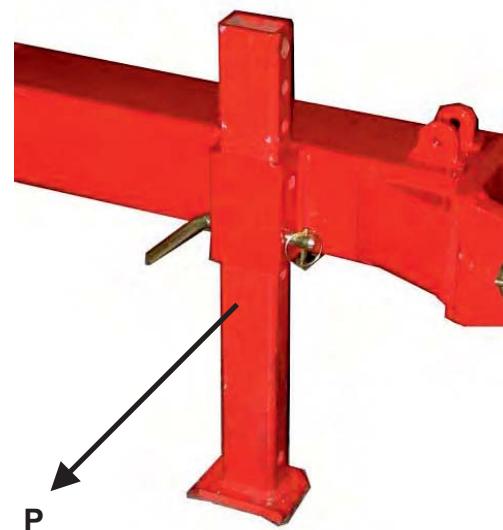

FIG. 13

The stand P (Fig.14) guarantees a steady position when the plough is parked. When parking the plough make sure that the locking pin of the stand is placed in the right hole so that the draw bar is horizontal. When ploughing the stand must be in the position marked as P1.

FH

## 6.- OPTIONAL EQUIPMENT

### 6.1.- TRASH BOARDS

The trash boards can be adjusted by means of brackets S provided with slotted holes (Fig.15)

### 6.2.- SKIMMERS

The working depth of the skimmers must be set at 7cm approximately. The skimmers are adjusted properly when the skimmed slice falls cleanly to the bottom of the furrow. Fixing bolts T must be tightened strongly. (Fig.16, 17)

Fig. 15

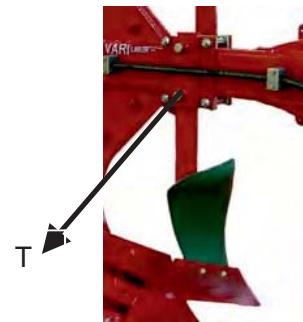

Fig. 16

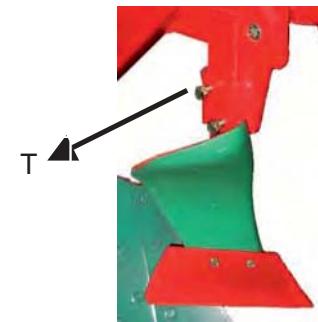

Fig. 17

### 6.3.- DISC COULTERS

Disc coulters should be set at a working depth of aprox. 8-10 cm and at a distance of aprox. 2cm towards the furrow wall parallel to the landslide .

To adjust the depth, loosen bolt T, turn arm B to the desired position and tighten firmly (Fig 18, 19)

To adjust the discs laterally, loosen clamp A and adjust shank M appropriately (Fig.18, 19)

The turn of arm B must be limited by means of stop G so that the discs do not hit any other element of the plough in the turn over manoeuvre.

Auto reset coulter discs are also available. To adjust its depth place bolt D in the desired position (Fig.20)

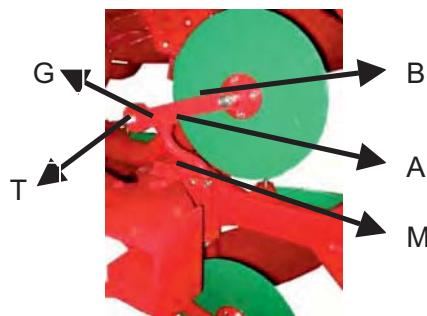

Fig. 18

Fig. 19

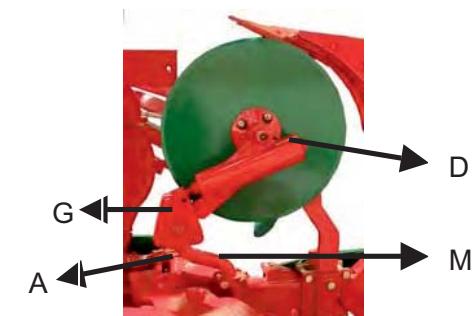

Fig. 20

#### 6.4.- OTHER OPTIONS

Other options are available such as share knives, landslide extension or mouldboard presses.

### 7.- MAINTENANCE

The points marked in Fig. 21 and 22 must be greased with the following periodicity:

- 1- every 10 working hours
- 2- every 50 working hours
- 3- every 100 working hours

As a general rule, all of these points should be greased before and after every season.

**IMPORTANT:** Check regularly that all bolts and nuts are properly tightened.
